SUMMARY

I am the **machine learning lead** at a **healthcare startup**. I have experience **creating breakthrough big data products**, including a **deep learning-based classifier** that **correctly predicts twelve times more heart attacks** than existing clinical models. I have rigorous training in **statistical genetics, machine learning, chemical biology,** and **epidemiologic methods**. I **finished my PhD in three years**, and have completed a total of **eight lead author manuscripts** and **two software packages**.
SKILLS

Performance computing: Python, R, C, Julia, Unix, SQL, AWS EC2, distributed computing (e.g. hadoop), pandas, sklearn, matplotlib, seaborn, bokeh.
Statistics/Machine Learning: Probability theory, classification (neural networks, gradient boosting, etc.) regression, clustering, feature selection, visualization.
Genetics/Clinical informatics: Whole-genome sequencing, other high throughput experimental data (RNAseq, proteomics, etc.), disease modeling, drug design, clinical trials.

WORK EXPERIENCE

Physiosigns Inc. *Machine Learning Lead*　　　　　**May 2016 to Present**
Built end-to-end machine learning pipeline. Leveraged deep learning to increase the number of heart attacks detected by twelve-fold. Designed interactive presentation of results to patients and doctors that includes accurate probabilities, quantified uncertainty, key personalized risk factors, and projected trends over time.

Human Longevity Inc. *Data Scientist*　　　　**November 2014 to May 2016**
Spearheaded an interdisciplinary team of PhDs to achieve breakthroughs in forensic genomics. Invented the most sensitive method to-date for detecting contamination in next-generation sequencing data. Applied software and wet-lab experience to propose $6 million per year reduction in sequencing costs.

Francis I. Proctor Foundation *Software Engineer*　　**June 2010 to May 2011**
Built high-performance probabilistic disease model to quantify cost of antibiotic resistance in *S. pneumoniae* using a system of over 23,000 differential equations. Calculated timeline for competitively eliminating resistance.

SOFTWARE PACKAGES

MOSAIC, a method for discovering, e.g. the genetic basis of human-specific diseases
http://pythonhosted.org/bio-MOSAIC
CauseMap, a tool for establishing causality in complex non-linear systems
http://cyrusmaher.github.io/CauseMap.jl

LEADERSHIP

- Led fourteen PhD scientists to complete work forms the foundation for a possible $1 billion forensics business.
- Mentored two graduate students. One mentee's findings have improved HLI's use of metabolomic data. The other won an NSF scholarship based on our work.
- Taught five semesters of General and Organic Chemistry at UC Berkeley, in addition to years of tutoring and volunteer experience.

GRADUATE
COURSEWORK
GRADUATE
RESEARCH

UC San Francisco *Graduate Student*   **June 2011 to November 2014**
Projects included: statistical methods development and deployment, scoring and integration of complex experimental data, investigation of genetic basis of human disease.

UC Berkeley *Research Scientist*   **June 2009 to June 2010**
Conducted a comprehensive literature review of cost-effectiveness of influenza vaccination. Combined with own disease modeling to quantify economic cost of influenza.

UC Berkeley *Graduate Student*   **Sept. 2007 to May 2009**
Leveraged computational tools to design improved inhibitors against tuberculosis. Approaches included molecular simulation, isosteric ligand design, and molecular docking.

AWARDS &
HONORS

Ruth L. Kirschstein National Research Service Award, 2013 to 2014.
Lloyd M. Kozloff Fellowship, 2013 to 2014.
National Merit Scholarship, 2002 to 2006.
Rensselaer Medal, 2001 ($100K value, awarded to best student in math and science).
